Fundamentals Of Engineering Mechanics Hydraulic

Hydraulic engineering as a sub-discipline of civil engineering is concerned with the flow and conveyance of fluids, principally water and sewage. One feature of these systems is the extensive use of gravity as the motive force to cause the movement of the fluids. This area of civil engineering is intimately related to the design of bridges, dams, channels, canals, and levees, and to both ...

Fundamentals of Fluid Flow. Principles relating to fluids at rest can be obtained with no ambiguity by purely rational methods. Some natural principles which are universally true are the basis of calculations. In flowing fluid, however, the laws that govern the motion are complex and most of the time defies mathematical expressions. Thanks to experimental data combined with mathematical theories which solved countless engineering problems in the past.

In general, the hydraulic head, or total head, is a measure of the potential of fluid at the measurement point. It can be used to determine a hydraulic gradient between two or more points. In fluid dynamics, head is a concept that relates the energy in an incompressible fluid to the height of an equivalent static column of that fluid.
