Introduction To The Periodic Table

The periodic table lists elements by atomic number, which is the number of protons in every atom of that element. Atoms of an atomic number may have varying numbers of neutrons (isotopes) and electrons (ions), yet remain the same chemical element. Elements in the periodic table are arranged in periods (rows) and groups (columns).

Introduction to the Periodic Table of Elements

The periodic table is used as a predictive tool. It arranges the elements in order of increasing atomic number. Elements that exhibit similar chemistry appear in vertical columns called groups (numbered 1-18 from left to right); the seven horizontal rows are called periods.

2.8: An Introduction to the Periodic Table - Chemistry ...

The periodic table is structured as an 18 X 7 grid, positioned above a smaller double row of elements. The periodic table only lists chemical elements, and includes each isotope of each element within one cell. In the typical periodic table, each element is listed by its element symbol and atomic number.

Introduction to the Periodic Table

The periodic table was proposed by Russian chemist Dmitri Mendeleev in 1869. Using the table, Mendeleev was able to accurately predict the properties of many elements before they were actually discovered. Fun facts about the Periodic Table Carbon is unique in that it is known to form up to 10 million different compounds.
